Q: Creating a Graph without using igraph Library I need to do some simple graph algorithms in python that don't require the igraph Library to be installed. I just need to create an empty graph. My code will not run if I just do `g.add_edges()` from an empty dictionary or list. All the examples I've been able to find in the documentation on the website only show how to create graphs that you have imported from igraph. Any help would be great! I've looked at some examples on fortran. I looked at the pydot library. A: If all you need is a graph structure, you could just use `collections.defaultdict(list)` for your adjacency matrix: `import collections graph = collections.defaultdict(list) # graph[i] is a list, not a dict # graph[i][j] is the list item at index i and jth member of that list graph[0] = [0] graph[1] = [1] graph[2] = [1,2] print(graph)` You could also use the `collections.Counter` to create the graph structure in one step: `import collections graph = collections.Counter() # graph[i] is a dictionary, not a list # graph[i][j] is the dictionary item for which i is the key and j is the value for i in range(3): for j in range(i+1): graph[i] += [j] print(graph)` Q: Incorrect version of sh is loaded and tries to execute a binary which doesn't exist I'm running a CentOS release 6.5 with root privileges. Everything is running great. I've installed gcc-4.4.1 with the following yum install gcc-4.4.1 and currently my gcc version is gcc (GCC) 4.4.1 20060831 (Red Hat 4.4.1-11) However when I try to execute a shell script I got the following error line 1: `/opt/tmp/myscript.sh: No such file or directory` In the script there is no path for `/opt/tmp/` directory. [Blocking effect of MK-801 on the renewal of cocaine self-administration after a non-contingent or contingent procedure]. In order to know if the blockade of the N-methyl-D-aspartate receptor with the D-AMPA/kainate glutamate antagonist, MK-801, could affect the renewal of cocaine self-administration, male Wistar rats were trained to a fixed ratio (FR) 5, non-contingent procedure. The animals showed a progressive increase in the number of operant responses until responding reached a stable level. In the first test of the spontaneous recovery of self-administration, after a 30 min non-contingent period, mice were challenged with MK-801 (1.5 mg/kg) or saline and the lever responses were measured during 60 min. Administration of MK-801 prevented the renewal of self-administration under the non-contingent conditions, but not when the administration was self-initiated. The animals were then submitted to a progressive ratio schedule of reinforcement, a procedure characterized by the progressive increase in the required number of responses before obtaining a reinforcer (continuous reinforcement). Similar to the non-contingent procedure, MK-801 blocked the renewal of self-administration. However, in this case the blockade was more robust and shorter in duration, being significant from the second to the fifth week. The self-administration of a 0.3 mg/kg dose of cocaine was also tested. Similar results were obtained with the non-contingent and the progressive ratio self-administration procedures, with the exception that in the latter MK-801 was still effective after the 4th week. The blockade of self-administration of a smaller dose of cocaine (0.3 mg/kg) is weaker than that observed with higher doses and we think it is this phenomenon that characterizes the renewal of the response.(ABSTRACT TRUNCATED AT 250 WORDS)Q: Maintaining a list of files and dates in Python I'm trying to maintain a list of files (these will be images) and the dates they were last modified. My thought is, I want to grab the newest file (by date). Then I want to have a list of all images (contingent on the last image in the list being modified). I then want to grab the date and modify the list (append). So far, I can successfully print the
